

modification (gluten-free diet) have been used.^[9] Long-term disease course and natural history of CG are variable. In most of the cases, CG seems to have a chronic persistent disease pattern but may have complete resolution in occasional cases.^[10] It has been suggested that collagen thickness may have a role in the disease course and its severity.^[9] There is no definite information on long-term development of dysplasia or malignancy.

In summary, we present another case of CG to add to the limited pool of cases of this rare condition. The symptoms in our patient had been persistent, but the diagnosis was missed in a recent workup. We hope to raise awareness among clinicians to consider CG in the differential diagnosis for a young female presenting with anemia and gastrointestinal symptoms. Our case highlights the need for a more careful examination during endoscopy, and it stresses on the role of an observant pathologist in making this diagnosis.

Consent

Informed consent was obtained from the patient.

Declaration of patient consent

The authors certify that they have obtained all appropriate patient consent forms. In the form the patient(s) has/have given his/her/their consent for his/her/their images and other clinical information to be reported in the journal. The patients understand that their names and initials will not be published and due efforts will be made to conceal their identity, but anonymity cannot be guaranteed.

Financial support and sponsorship
